## Product Information Bulletin – RegO 3165 Series Vent Valves

RegO 3165 Series Vent Valves are designed to provide a visible warning when containers are filled to the maximum permitted filling level. When the maximum permitted filling level of a container is reached, the 3165 Series Vent Valve discharges a small amount of liquid which indicates to the operator that the filling operation should stop.

RegO 3165 Series Vent Valves are covered by RegO’s Limited 10 year warranty as are all RegO LP-Gas products. This warranty does not extend to any product or part that has been altered or modified in the field. **Do not alter, modify the stem, body crimp or any part of a 3165-Series Vent Valve as you can create a safety hazard.**

RegO 3165 Series Vent Valves are designed to retain the stem in the body of the valve; any RegO 3165 Series Vent Valve that has been altered or modified in the field has changed the valve from its original design. This includes but is not limited to damage to the crimped end that retains the stem in the body of the valve. Damaging or eliminating this crimp feature will defeat an important safety feature of this valve and will void our warranty.

Should you have any questions, please contact RegO at 336-449-7707.
